

TEACHABILITY FRAMEWORK

Zero-Waste Bio-Conversion & Co-Gen Systems

Off-Grid Agricultural Industrial Engineering & Energy Integration

SETA STANDARD	NQF LEVEL	CREDITS & WEIGHT	LOCATION CONTEXT
US 116115	Level 3	12 Credits (15%)	Kinross & Secunda

Executive Summary & Baseline Objectives

Modular Off-Grid Energy & High-Density Livestock Integration

Closed-Loop Vision

Repurposes organic animal waste (manure) into high-purity methane fuel. Drives on-site co-generation systems to generate night-time electrical volts and direct subsurface radiant steam heat, achieving total utility grid independence.

Bankable Yield Matrix

ZAR 3.1M

TOTAL ASSET CAPEX

Yields a 2.6-year investment payback period through highly insulated, zero-grid operational margins that insulate agricultural cash flows from rising power tariffs.

Market Gaps & Utility Vulnerability

Structural Deficits in Conventional Highveld Farming

Grid Deficit Exposure

Sustained Highveld blackouts disrupt automated mechanical ventilation systems and critical brooding heat cycles, leading to high shock mortalities.

Thermodynamic Volatility

Uninsulated, conventional barn envelopes allow freezing winter cold snaps, triggering severe hypothermia in piglets and broilers.

The Retail Cost Trap

Relying on escalating retail utility tariffs for heavy space heating completely consumes gross farming profit margins during winter.

Closed-Loop Engineering Infrastructure

Unifying Biology with Co-Generation Engineering

Passive Siphon Thermal Chimneys

Convective roof ridge chimneys leverage natural thermodynamic lift to reduce electric ventilation power draw to zero.

4-Pod Biosecurity Firewalls

Modular partition walls limit bio-exposure down to a maximum of 25% zone footprint per outbreak event.

Co-Generation Heat Thermal Sync

Diverts engine jacket thermal exhaust directly into sub-floor radiant steam heating manifolds.

Passive Thermodynamic Architecture

Highveld Climate Adaptation Logic

Structural Passive Design Elements

- **Optimal Solar Orientation:** East-West axial alignment maximizes winter solar heat recovery along Northern facing walls.
- **Passive Convective Ventilation:** Low-inlet cross-ventilation paired with high-ridge discharge slots.
- **Thermal Envelope Storage:** High-density brickwork acts as a thermal battery, storing ambient heat during daylight hours.

Micro-Climate Control Impact

By eliminating mechanical cooling reliance during heatwaves and using zero-electricity thermal siphon channels, baseline power draw remains entirely flat year-round, avoiding expensive peak-demand utility penalties.

Multi-Channel Business Revenue Pipelines

Diversified High-Velocity Agricultural Revenue

Broiler Sprint Barn

- Staggered 6-wave poultry occupancy annually.
- 5,760 broilers harvested per wave.
- Target Market Price: ZAR 38.00 / kg.

Swine Grower Pipeline

- 3 batches/year of 160 grower pigs.
- Fattening from 7kg to 70kg carcass weight.
- Target Market Price: ZAR 32.00 / kg.

Organic Bio-Solids

- High-nutrient anaerobic digester discharge.
- Processed and bagged as bio-fertilizer.
- Creates secondary auxiliary margin stream.

Consolidated Capital Ledger (CAPEX)

ZAR 3,100,000 Total Allocation Breakdown

ASSET INFRASTRUCTURE COMPONENT	CAPEX VALUE (ZAR)	ENGINEERING & RISK MITIGATION FUNCTION
Poultry & Swine Structural Shells	ZAR 1,220,000	Establishes insulated thermal envelopes and passive ventilation channels.
30kW/30kWh BESS & Biogas Co-Gen	ZAR 1,070,000	Supplies off-grid electrical volts and radiant steam floor-mats.
Hydrology, Biosecurity & ArIoT System	ZAR 810,000	Inline UV water sanitizers, shower-in portals, and real-time alerts.

Energy Self-Sufficiency & Tariff Shield

Financial Safety & Capital Amortization Logic

MODEL BASE TARIFF SHIELD

ZAR 1.80

SAVED PER KWH GENERATED

Preserving Investment Capital

- **Conservative Model:** Financial projections lock in a baseline ZAR 1.80/kWh grid tariff saving rate.
- **Autonomous Sinking Fund:** 100% of energy utility savings are funneled into a dedicated replacement reserve fund.
- **Upgrade Capability:** Sinking fund fully finances battery & inverter upgrades by Year 5 without secondary debt.

5-Year Growth & EBITDA Projections

Financial Resiliency via Locked Zero Utility Costs

FINANCIAL PERFORMANCE YEAR	PROJECTED EBITDA (ZAR)	OPERATIONAL MARGIN DRIVERS
Year 1 EBITDA	ZAR 1,180,000	Initial yield ramp across 6 broiler waves & swine batches.
Year 2 EBITDA	ZAR 1,280,000	Process optimization & bio-fertilizer commercialization.
Year 3 EBITDA	ZAR 1,400,000	Full operational efficiency across closed-loop infrastructure.
Year 5 EBITDA	ZAR 1,500,000	Maximum density yield with zero utility exposure.

6-Month Launch Execution Roadmap

Phased Site Commissioning Timeline

Months 1 – 3

Civil Infrastructure

Excavation, structural steel frames, and 2% drainage sub-floors.

Months 4 – 5

Energy Integration

Installing solar roof arrays, BESS, and biogas steam manifolds.

Month 6

Biosecurity & Launch

Deep chemical sterilizations, ArIoT calibration, and initial livestock loading.

JET Empowerment & Social Dividends

Alignment with Just Energy Transition Frameworks

Skills Transition

Accredited green-tech training in bio-solar microgrid operations for local youth in Kinross & Secunda mining communities.

Inclusive Growth

Dedicated management development programs for women-led agricultural cooperatives in the Mpumalanga region.

Community Alliances

Direct execution partnerships with local NPOs and community foundations.

INVESTMENT PROSPECTUS CERTIFIED

Total CAPEX: ZAR 3,100,000

2.6 Years Payback Period
